Extending LLM Context Window with Adaptive Grouped Positional Encoding: A Training-Free Method

Xinhao Xu*, Jiaxin Li*, Hui Chen†, Zijia Lin, Jungong Han, Guiguang Ding†

Introduction

- **Extending Long-Context Processing Capabilities**
  - Training on high-quality long-context datasets at scale:
    - 😊 High performance
    - 😭 Limited data availability
    - 😭 High time and hardware costs
  - Training-free positional encoding remapping methods:
    - 😊 Low-cost scalability
    - 😊 High flexibility
    - 😭 Limited performance

Research Problem

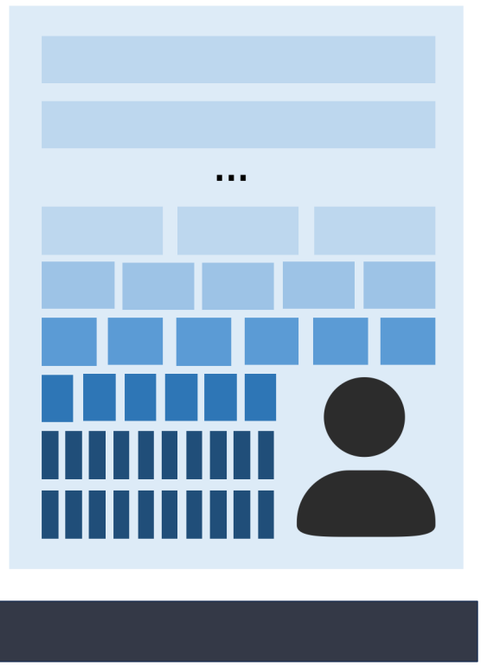

How to improve mapping strategies for better performance of training-free methods?

- **Intuitive Ideas**
  - Prioritize relative positions of nearby tokens, inspired by RoPE's long-distance decay design.
  - Align with human perception and processing patterns of long-context sequences.

Plug-and-play, training-free

Dynamically adapts to various scenarios

Easily combined with training methods

Method

- **A Implementation of Adaptive Grouped Positional Encoding**
  - Minimizing reuse and prioritizing distant relative position reuse
  - Progressive increase in reuse count from close to distant

$$r_n = \begin{cases} \left\lfloor \frac{r}{n} \cdot P \right\rfloor & \text{if } \log_2 n \in \mathbb{N}, \\ 0 & \text{otherwise,} \end{cases}$$

→ Minimum retained positions used n times when maximum usage count $> n$

  - Adaptive relative position adjustment strategy

- **Pseudocode for Relative Position Computation in AdaGroPE during Decoding**

Input: L ▷ Target context length after extension
P ▷ Number of relative positions used
r ▷ Reuse ratio coefficient
Output: m_a ▷ Relative position in AdaGroPE

function AdaGroPERelPos(L, P, r)
  if $L \leq P$ **then**
    $m_a \leftarrow [L-1, L-2, \ldots, 0]$
    return m_a
  end if
  $G_s^m \leftarrow 1$
  $L_n^{\max} \leftarrow P$
  $r_{\text{sum}}, l_{\text{sum}} \leftarrow 0$
  $m_a \leftarrow [\,]$
  while $L_n^{\max} < L$ **do**
    if isPowerOfTwo(G_s^m) **then**
      $r_n \leftarrow \lfloor r \times P / G_s^m \rfloor$
      for $p = r_{\text{sum}}$ to $r_{\text{sum}} + r_n - 1$ **do**
        prepend p to m_a for G_s^m times
      end for
      $r_{\text{sum}} \leftarrow r_{\text{sum}} + r_n$
      $l_{\text{sum}} \leftarrow l_{\text{sum}} + r_n \times G_s^m$
    end if
    $G_s^m \leftarrow G_s^m + 1$
    $L_n^{\max} \leftarrow (P - r_{\text{sum}}) \times G_s^m + l_{\text{sum}}$
  end while
  $d_{n-1} \leftarrow P - (L_n^{\max} - L) - r_{\text{sum}}$
  for $p = r_{\text{sum}}$ to $P - d_{n-1} - 1$ **do**
    prepend p to m_a for $G_s^m - 1$ times
  end for
  for $p = P - d_{n-1}$ to $P - 1$ **do**
    prepend p to m_a for G_s^m times
  end for
  return m_a
end function
